Eessõna / Foreword

Tallinna lennuvälja kliimateatmik on Tallinna Lennujaama meteoroloogiliste andmete statistiline analüüs. Teatmik sisaldab 22aastase perioodi (1997-2018) kohta meteoroloogiliste elementide (nähtavus, pilvede kõrgus, tuule kiirus ja suund, tuule puhangud ja suund, õhutemperatuur, õhurõhk, suhteline niiskus, atmosfäärinähtused, sademed) jaotust ning olulisemaid lennu-meteoroloogilisi statistilisi näitajaid.

Analüüs tugineb Rahvusvahelise Tsiviillennunduse Organisatsiooni (ICAO) ja Ülemaailmse Meteoroloogia-organisatsiooni (WMO) kliimaandmete töötlemise soovitustele (ICAO konventsiooni 3. lisa; WMO Tehnilised regulaatsioonid nr 49, Vol 2).

Sarnane kliimateatmik on varasemalt välja antud 1969. aastal ning lühiversioon 1975. aastal.

Tallinn aerodrome Climate handbook is a statistical analysis of the observations data provided by Tallinn Airport. The handbook covers a 22-year period between 1997 – 2018, and contains the distribution of meteorological elements (visibility, cloud height, wind speed and direction, wind gust and direction, air temperature, air pressure, relative humidity, atmospheric phenomena, precipitation), and significant statistical parameters of aviation meteorology.

The analysis are based on the recommendations of the International Civil Aviation Organization (ICAO) and the World Meteorological Organization (WMO) on climatological data processing (Annex 3 to the Convention of the ICAO; WMO Technical regulation no 49, Vol 2).

A similar climate handbook was published in 1969 and a short version in 1975.

Kliima

Tallinna lennuväli asetseb Põhja-Eesti lavamaa Lasnamäe paekivist klindil, suhtelise kõrgusega rannamadalikust (Tallinna linnast) 40 m. NNW suunas 4 km kaugusel asub Tallinna laht, läänes umbes 10 km² suurune Ülemiste järv.

Peamine Tallinna kliimat mõjutav tegur on geograafiline asend Soome lahe lõunakaldal. Eesti kuulub paravöötme Atlantilise kontinentaalse regiooni segametsade allregiooni ning asub merelise ja mandrilise kliima vahelises üleminekuvööndis. Köppeni kliimaklassifikatsiooni kohaselt kuulub Eesti mandriosa *Dfb* (külma talvega niiske mandriline kliima) kliimatüipi. Soome laht soojendab talvel rannikupiirkonda, samas on just kevadel alale jahutav mõju. Kuna sademete hulk aastas ületab aurumise peaaegu kahekordsest, on kliima niiske.

Tallinna kliimale on üldiselt iseloomulik mõõdukalt külm talv, väheste sademetega jahe kevad, mõõdukalt soe, algul suhteliselt kuiv, teisel poolel vihmane suvi ning pikk soe sügis. Kliima on mõjutatud põhiliselt tsüklonaalsest tegevusest: enamik tsükloneid lähtub Põhjamerelt, esineb ka nn norra ja lõunatsükloneid. Mereääärse asendi tõttu on Tallinnas kogu aeg tuuline (keskmene tuule kiirus 7,5 kt). Tallinnas puhuvad tuuled valdavalt edela-, lõuna- ja läänekaartest. Põhjakaarte tuuled esinevad sagedamini kevadel ja varasuvel. Tuuled on tugevaimad sügis- ja talvekuudel, eriti novembris (7,9 kt), detsembris (8,5 kt) ja jaanuaris (7,9 kt). Kõige nõrgem on tuul suvel juulis (6,8 kt) ja augustis (6,5 kt).

Climate

Tallinn Airport is located at the Lasnamäe limestone klint of the North-Estonia plateau with a relative height from fore-clint lowland (the city of Tallinn) 40 m. Tallinn Bay lies 4 km from the Airport (bearing NNW), Lake Ülemiste (approx. 10 km²) lies to the west.

The main factor influencing the climate of Tallinn is its geographical location at the southern coast of the Gulf of Finland. Estonia belongs to the mixed forest subregion of the Atlantic continental region of the temperate zone, and is also within a transition zone from maritime to continental climate. According to the Köppen climate classification, the continental part of Estonia belongs to the *Dfb* (moist continental climate with cold winter) climate type. The Gulf of Finland warms coastal regions in winter; in spring, however, it has a cooling effect. As the annual amount of precipitation exceeds evaporation almost two times, the climate is moist.

The climate in Tallinn is generally characterized by a moderately cold winter, a cool spring with scarce precipitation, initially relatively dry, but later quite rainy summer and a long warm autumn. The climate is mostly affected by cyclonic activities, the majority of which are born in the North Sea, however, the so-called Norwegian and southern cyclones are not rare either. Due to its location by the sea, Tallinn is constantly windy (average wind speed is 7.5 kt). Prevailing are south-westerly, southerly and westerly winds. In spring and early summer northerly winds take the upper hand. Winds are strongest in autumn and winter, especially in November (7.9 kt), December (8.5 kt) and January (7.9 kt). Winds are weakest in July (6.8 kt) and August (6.5 kt).

Mean	-	-	-	2.4	6.5	3.2	19.4	48.6	64.7

8000 m nähtavuskauguse ja 2000 jala kõrguse pilve alumise piiri asemel on kasutatud vastavalt väärtsusi 5000 m ja 1500 jalga, mis on kohalike lennuprotseduuride ja erakorraliste ilmateadete aluseks.

Raja nähtavuskauguse väärtsusi alla 200 m jaanuaris ei esinenud. Alla 1500 m horisontaalse nähtavuse ja/või alla 500 jala pilve alumise piiri kõrguse esinemissagedus on 19,4%.

Instead of general visibility 8000 m and cloud base 2000 ft, visibility 5000 m and cloud base 1500 ft were used, since these are the limit values in local flight procedures and special weather reports.

In January, the observed occurrence of the Runway Visual Range minimum values below 200 m were not detected. The occurrence frequency of horizontal visibility below 1500 m and/or cloud ceiling below 500 ft in January is 19.4%.

8000 m nähtavuskauguse ja 2000 jala kõrguse pilve alumise piiri asemel on kasutatud vastavalt väärtsusi 5000 m ja 1500 jalga, mis on kohalike lennuprotseduuride ja erakorraliste ilmateadete aluseks.

Raja nähtavuskauguse väärtsusi alla 200 m veebruaris ei esinenud. Alla 1500 m horisontaalse nähtavuse ja/või alla 500 jala pilve alumise piiri kõrguse esinemissagedus on 17,9%.

Instead of general visibility 8000 m and cloud base 2000 ft, visibility 5000 m and cloud base 1500 ft were used, since these are the limit values in local flight procedures and special weather reports.

In February, the observed occurrence of the Runway Visual Range minimum values below 200 m was not detected. The occurrence frequency of horizontal visibility below 1500 m and/or cloud ceiling below 500 ft in February is 17.9%.

8000 m nähtavuskauguse ja 2000 jala kõrguse pilve alumise piiri asemel on kasutatud vastavalt väärtsusi 5000 m ja 1500 jalga, mis on kohalike lennuprotseduuride ja erakorraliste ilmateadete aluseks.

Raja nähtavuskauguse väärtsusi alla 200 m mais ei esinenud. Alla 1500 m horisontaalse nähtavuse ja/või alla 500 jala pilve alumise piiri kõrguse esinemissagedus on 7,2%.

Instead of general visibility 8000 m and cloud base 2000 ft, visibility 5000 m and cloud base 1500 ft were used, since these are the limit values in local flight procedures and special weather reports.

In May, the observed occurrence of the Runway Visual Range minimum values below 200 m was not detected. The occurrence frequency of horizontal visibility below 1500 m and/or cloud ceiling below 500 ft in May is 7.2%.

8000 m nähtavuskauguse ja 2000 jala kõrguse pilve alumise piiri asemel on kasutatud vastavalt väärtsusi 5000 m ja 1500 jalga, mis on kohalike lennuprotseduuride ja erakorraliste ilmateadete aluseks.

Raja nähtavuskauguse väärtsusi alla 200 m esines septembris ainult kolmel vaatlusaljal. Alla 1500 m horisontaalse nähtavuse ja/või alla 500 jala pilve alumise piiri kõrguse esinemissagedus on 6,8%.

Instead of general visibility 8000 m and cloud base 2000 ft, visibility 5000 m and cloud base 1500 ft were used, since these are the limit values in local flight procedures and special weather reports.

In September, observed occurrence of the Runway Visual Range minimum values below 200 m were measured only at three observational time. The occurrence frequency of horizontal visibility below 1500 m and/or cloud ceiling below 500 ft in September is 6.8%.

8000 m nähtavuskauguse ja 2000 jala kõrguse pilve alumise piiri asemel on kasutatud vastavalt väärtsusi 5000 m ja 1500 jalga, mis on kohalike lennuprotseduuride ja erakorraliste ilmateadete aluseks.

Raja nähtavuskauguse väärtsusi alla 200 m detsembris ei esinenud. Alla 1500 m horisontaalse nähtavuse ja/või alla 500 jala pilve alumise piiri kõrguse esinemissagedus on 15,9%.

Instead of general visibility 8000 m and cloud base 2000 ft, visibility 5000 m and cloud base 1500 ft were used, since these are the limit values in local flight procedures and special weather reports.

In December, the observed occurrence of the Runway Visual Range minimum values below 200 m was not detected. The occurrence frequency of horizontal visibility below 1500 m and/or cloud ceiling below 500 ft in December is 15.9%.

EETN WIND DIRECTION AND WIND GUST SPEED DISTRIBUTION (%), JANUARY 1997-2018

Jaanuaris esineb kõige enam tuulepuhanguid suunast 230 kraadi (0,41%). Puhanguid ei ole olnud suundadest 90-100 kraadi. Enim esineb tuulepuhanguid väärtsusega 26-30 sõlme (1,97%).

In January, the main wind gust direction is 230 degrees (0.41%). There have not been gusts from directions of 90-100 degrees. Wind gust speed usually varies between 26-30 knots (1.97%).

EETN WIND DIRECTION AND WIND GUST SPEED DISTRIBUTION (%), OCTOBER 1997-2018

Oktoobris esineb kõige enam tuule puhanguid suunast 50 kraadi (0,25%). Puhanguid ei ole olnud suunast 90 kraadi. Enim esineb tuule puhanguid väärtsusega 26-30 sõlme (1,73%).

In October the main wind gust direction is 50 degrees (0.25%). There have not been gusts from direction of 90 degrees. Wind gust speed usually varies between 26-30 knots (1.73%).

23:50	8.2	4.1	-	0.9	1.5	1.5	4.9	11.3
Mean	8.8	5.1	-	0.9	0.8	1.1	4.9	11.0

Muud atmosfäärinähtused ei ole eristatud. Vihm lumega (RASN) on määratud vihmaks, lumi vihmaga (SNRA) on märgitud lumeks. Kerget lumesadu ei ole arvestatud protsentuaalselt liiga kõrge lumesaju määra tõttu, mis võib viia valede järedusteni. Jäätuvi vihm (FZRA) ja jäätuv uduvihm (FZDZ) ei ole eraldi välja toodud vaid on arvestatud vastavalt vihmana (RA) ja uduvihmana (DZ). Hoogvihm (SHRA) on määratud vihmaks ja hooglumi (SHSN) on määratud lumesajuks.

Jaanuaris esineb atmosfäärinähtustest kõige enam lumesadu ning uduvinet (vastavalt 11,0 ja 8,8%).

Other weather phenomenas are not distinguished. Rainsnow (RASN) is classified as rain, snowrain (SNRA) is located under snow criterion. Light snow is not included due to too high snowfall percentages which leads to false conclusions. Freezing rain (FZRA) and freezing drizzle (FZDZ) are not separated as well and are situated under rain (RA) and drizzle (DZ) criterion correspondingly. Showers of rain (SHRA) are classified as rain ja showers of snow (SHSN) are classified as snowfall.

In January, most frequent weather phenomenas are snowfall and mist (11.0 and 8.8% accordingly).

Muud atmosfäärinähtused ei ole eristatud. Vihm lumega (RASN) on määratud vihmaks, lumi vihmaga (SNRA) on märgitud lumeks. Kerget lumesadu ei ole arvestatud protsentuaalselt liiga kõrge lumesaju määra tõttu, mis võib viia valede järeldusteni. Jäätuv vihm (FZRA) ja jäätuv uduvihm (FZDZ) ei ole eraldi välja toodud vaid on arvestatud vastavalt vihma (RA) ja uduvihma (DZ). Hoogvihm (SHRA) on määratud vihmaks ja hooglumi (SHSN) on määratud lumesajuks.

Mais esineb atmosfäärinähtustest kõige enam vihma (6,1%).

Other weather phenomena are not distinguished. Rainsnow (RASN) is classified as rain, snowrain (SNRA) is located under snow criterion. Light snow is not included due to too high snowfall percentages which leads to false conclusions. Freezing rain (FZRA) and freezing drizzle (FZDZ) are not separated as well and are situated under rain (RA) and drizzle (DZ) criterion correspondingly. Showers of rain (SHRA) are classified as rain and showers of snow (SHSN) are classified as snowfall.

In May, most frequent weather phenomena is rain (6.1%).

Muud atmosfäärinähtused ei ole eristatud. Vihm lumega (RASN) on määratud vihmaks, lumi vihmaga (SNRA) on märgitud lumeks. Kerget lumesadu ei ole arvestatud protsentuaalselt liiga kõrge lumesaju määra tõttu, mis võib viia valede järeldusteni. Jäätuv vihm (FZRA) ja jäätuv uduvihm (FZDZ) ei ole eraldi välja toodud vaid on arvestatud vastavalt vihma (RA) ja uduvihmana (DZ). Hoogvihm (SHRA) on määratud vihmaks ja hooglumi (SHSN) on määratud lumesajuks.

Augustis esineb atmosfäärinähtustest kõige enam vihma ja madalat udu või udulaike (vastavalt 7,6 ja 3,6%).

Other weather phenomena are not distinguished. Rainsnow (RASN) is classified as rain, snowrain (SNRA) is located under snow criterion. Light snow is not included due to too high snowfall percentages which leads to false conclusions. Freezing rain (FZRA) and freezing drizzle (FZDZ) are not separated as well and are situated under rain (RA) and drizzle (DZ) criterion correspondingly. Showers of rain (SHRA) are classified as rain ja showers of snow (SHSN) are classified as snowfall.

In August, most frequent weather phenomena are rain and shallow fog or patches of fog (7.6 and 3.6% accordingly).

Muud atmosfäärinähtused ei ole eristatud. Vihm lumega (RASN) on määratud vihmaks, lumi vihmaga (SNRA) on märgitud lumeks. Kerget lumesadu ei ole arvestatud protsentuaalselt liiga kõrge lumesaju määra tõttu, mis võib viia valede järedusteni. Jäätuv vihm (FZRA) ja jäätuv uduvihm (FZDZ) ei ole eraldi välja toodud vaid on arvestatud vastavalt vihmana (RA) ja uduvihmana (DZ). Hoogvihm (SHRA) on määratud vihmaks ja hooglumi (SHSN) on määratud lumesajuks.

Detsembris esineb atmosfäärinähtustest kõige enam uduvinet, vihma ja lumesadu (vastavalt 7,7, 7,4 ja 7,3%).

Other weather phenomenas are not distinguished. Rainsnow (RASN) is classified as rain, snowrain (SNRA) is located under snow criterion. Light snow is not included due to too high snowfall percentages which leads to false conclusions. Freezing rain (FZRA) and freezing drizzle (FZDZ) are not separated as well and are situated under rain (RA) and drizzle (DZ) criterion correspondingly. Showers of rain (SHRA) are classified as rain ja showers of snow (SHSN) are classified as snowfall.

In December, most frequent weather phenomenas are mist, rain and snowfall (7.7, 7.4 and 7.3% accordingly).

Tallinn-Harku aeroloogiaajaama andmetel sajab kõige enam juulis (86,7 mm) ning kõige vähem mais ja märtsis (vastavalt 31,5 ja 31,6 mm). Tallinna Lennuväljal mõõdetakse sademeid ainult aasta soojal perioodil (mai-oktoober).

According to the Tallinn-Harku aerological station, the wettest month is July (86.7 mm) and the driest months are May and March (31.5 and 31.6 mm accordingly). At Tallinn Aerodrome precipitation are measured only during the warm period of a year (from May to October).

Kokkuvõte / Summary

Tallinna lennuvälja kliimateatmik on Tallinna Lennujaama meteoroloogiliste andmete statistiline analüüs. Teatmik sisaldab 22aastase perioodi (1997-2018) kohta meteoroloogiliste elementide jaotust ning olulisemaid lennu-meteoroloogilisi statistilisi näitajaid.

Analüüs tugineb Rahvusvahelise Tsiviilennunduse Organisatsiooni (ICAO) ja Ülemaailmse Meteoroloogia-organisatsiooni (WMO) kliimaandmete töötlemise soovitustele.

Raja nähtavuskauguse väärtsusi alla 200 m on esinenud üksikutel vaatluskordadel aprillis, juunis ja septembris. Alla 1500 m horisontaalse nähtavuse ja/või alla 500 jala pilve alumise piiri kõrguse esinemissagedus on suurim talvekuudel ning väikseim suvekuudel.

Kevadel ja suvel jäääb valdav tuule suund vahemikku 260-280 kraadi, sügisel ja talvel 200-220 kraadi. Keskmise tuule kiirus on vahemikus 6-10 sõlme.

Märtsis ja aprillis ning novembrist jaanuarini jäääb keskmise õhutemperatuuri vahemikku 0...5 kraadi, veebruaris -5...0, mais 5...10, juunis 10...15 ning juulis ja augustis 15...20 kraadi. Keskmise maksimaalne õhutemperatuuri on vahemikus 30...35 kraadi, keskmise minimaalne õhutemperatuur jäääb alla -20 kraadi.

Atmosfäärinähtustest esineb kõige enam vihma, uduvinet ja lumesadu (vastavalt 7,2, 5,3 ja 3,6%).

Kõige enam sajab juulis (86,7 mm) ning kõige vähem mais ja märtsis (vastavalt 31,5 ja 31,6 mm).

Tallinn aerodrome Climate handbook is a statistical analysis of the observations data provided by Tallinn Airport. The handbook covers a 22-year period between 1997 – 2018 and contains the distribution of meteorological elements, and significant statistical parameters of aviation meteorology.

The analysis are based on the recommendations of the International Civil Aviation Organization (ICAO) and the World Meteorological Organization (WMO) on climatological data processing.

The Runway Visual Range minimum values below 200 m were measured only at few observational occasions in April, June and September. The occurrence frequency of horizontal visibility below 1500 m and/or cloud ceiling below 500 ft is the highest during winter months and the lowest during summer months.

The prevailing wind direction in spring and in summer is 260-280 degrees, whereas in autumn and in winter it is 200-220 degrees. Wind speed is mainly 6-10 knots.

In March and April, as well from November to January, air temperature generally varies between 0...5 degrees, in February -5...0, in May 5...10, in June 10...15 and in July and August 15...20 degrees. The highest average air temperature varies from 30 to 35 degrees, whereas the lowest air temperature remains below -20 degrees.

Most frequent weather phenomena are rain mist, and snowfall (7.2, 5.3 and 3.6% accordingly).

The wettest month is July (86.7 mm) and the driest months are May and March (31.5 and 31.6 mm accordingly).
