Kasutatud kirjandus / References .....	128

## Eessõna / Foreword

Tartu lennuvälja kliimateatmik on Tartu Lennujaama meteoroloogiliste andmete statistiline analüüs. Teatmik sisaldab 7aastase perioodi (2014-2020) kohta meteoroloogiliste elementide (nähtavus, pilvede kõrgus, tuule kiirus ja suund, tuule puhangud ja suund, õhutemperatuur, õhurõhk, õhuniiskus, atmosfäärinähtused, sademed) jaotust ning olulisemaid lennu-meteoroloogilisi statistilisi näitajaid.

Analüüs tugineb Rahvusvahelise Tsiviillennunduse Organisatsiooni (ICAO) ja Ülemaailmse Meteoroloogia-organisatsiooni (WMO) kliimaandmete töötlemise soovitustele (ICAO konventsiooni 3. lisa; WMO Tehnilised regu-latsioonid nr 49, Vol 2).

Sarnane kliimateatmik on varasemalt välja antud 2019. aastal Tallinna Lennuvälja kohta.

Tartu aerodrome Climate handbook is a statistical analysis of the observations data provided by Tartu Airport. The handbook covers a 7-year period between 2014 – 2020, and contains the distribution of meteorological elements (visibility, cloud height, wind speed and direction, wind gust and direction, air temperature, air pressure, humidity, atmospheric phenomenas, precipitation), and significant statistical parameters of aviation meteorology.

The analysis are based on the recommendations of the International Civil Aviation Organization (ICAO) and the World Meteorological Organization (WMO) on climatological data processing (Annex 3 to the Convention of the ICAO; WMO Technical regulation no 49, Vol 2).

A similar climate handbook was published in 2019 for Tallinn Airfield.

## Asukoha ja kliima ülevaade / Overview of the location and climate

## Kliima

Tartu lennuväli paikneb Lõuna-Eesti lavamaal küllaltki tasasel alal, absoluutse körgusega merepinnast 67 m. Künklid kõrgustike piirkonnad jäävad lõuna poole. NNE suunas alla 10 km kaugusel asub Tartu linn. Lähemas ümbruses suuremaid veekogusid ei ole, Pepsi ja Võrtsjärv jäävad eri suunades ligikaudu 35 km kaugusele.

Peamine Tartu kliimat mõjutav tegur on geograafiline asend sisemaal kaugemal merest ja suurematest veekogudest. Eesti kuulub paravöötme Atlantilise kontinentaalse regiooni segametsade allregiooni ning asub merelise ja mandrilise kliima vahelises ülemineku vööndis. Köppeni kliimaklassifikatsiooni kohaselt kuulub Eesti mandrioska *Dfb* (külma talvega niiske mandriline kliima) kliimatüipi. Seetõttu on õhutemperatuuri äärmused sisemaal ilmekamad ja suuremad kui rannikul. Kuna sademete hulk aastas ületab aurumise peaaegu kahekordselt, on kliima niiske.

Tartu kliimale on üldiselt iseloomulik mõõdukalt külm talv, väheste sademetega jahe kevad, mõõdukalt soe, algul suhteliselt kuiv, hiljem vihmane suvi ning pikk soe sügis. Kontinentaalsema kliima tõttu on kevadel sageli soojem kui rannikul, seevastu sügisel ja talve alguses jahedam. Kliima on mõjutatud põhiliselt tsüklonaalsest tegevusest: enamik tsükloneid lähtub Põhja-Atlandilt ja Põhjamereelt, esineb ka niinimetatud norra ja lõunatsükloneid.

Sisemaa asendi tõttu on Tartus mõnevõrra vähem tuulisem kui rannikul (keskmise tuule kiirus 7,6 kt). Tartus puhuvad tuuled valdavalt edela-, lõuna- ja läänekaartest. Põhjakaarte tuuled esinevad sagedamini kevadel ja varasuvel. Tuuled on tugevaimad sügis- ja talvekuudel, eriti detsembris ja jaanuaris (9,1 kt) ning veebruaris (9,0 kt). Kõige nõrgem on tuul suvel augustis (6,7 kt) ja juulis (7,0 kt).

## Climate

Tartu Airport is located on a South-Estonia plateau which is a relatively flat, with absolute height from the sea level 67 m. Hilly uplands situates southwards. Tartu lies less than 10 km from the Airport (bearing NNE), At closer surrounding there are no major water bodies, lake Peipsi and Võrtsjärv are approximately 35 km away in different directions.

The main factor influencing the climate of Tartu is its geographical location in inland, far from sea and larger water bodies. Estonia belongs to the mixed forest subregion of the Atlantic continental region of the temperate zone, and is within a transition zone from maritime to continental climate also. According to the Köppen climate classification, the continental part of Estonia belongs to the *Dfb* (moist continental climate with cold winter) climate type. Therefore extremes of air temperature are more expressive and bigger than on a coastal areas. As the annual amount of precipitation exceeds evaporation almost two times, the climate is moist.

The climate in Tartu is generally characterized by a moderately cold winter, a cool spring with scarce precipitation, initially relatively dry, but later quite rainy summer and a long warm autumn. Comparing with coastal areas due to more continental climate in Tartu it is often warmer in spring, but colder in autumn and beginning of winter. The climate is mostly affected by cyclonic activities, the majority of which are born over Northern Atlantic and over the North Sea, however, the so-called Norwegian and southern cyclones are not rare either.

Due to its location in inland, far from sea, Tartu is less windy than coastal areas (average wind speed is 7.6 kt). Prevailing are south-westerly, southerly and westerly winds. In spring and early summer northerly winds take the upper hand. Winds are strongest in autumn and winter, especially in December, January (9.1 kt) and in February (9.0 kt). Winds are weakest in August (6.7 kt) and in July (7.0 kt).

8000 m nähtavuskauguse ja 2000 m pilve alumise piiri asemel on kasutatud vastavalt väärtsusi 5000 m ja 1500 jalga, mis on kohalike lennuprotseduuride ja erakorraliste ilmateadete aluseks.

Raja nähtavuskauguse esinemissagedus alla 200 m on jaanuaris 0,2%. Alla 1500 m horisontaalse nähtavuse ja/või alla 500 jala pilve alumise piiri kõrguse esinemissagedus on 16,2%.

Instead of general visibility 8000 m and cloud base 2000 ft, visibility 5000 m and cloud base 1500 ft were used, since these are the limit values in local flight procedures and special weather reports.

In January, the observed occurrence of the Runway Visual Range minimum values below 200 m is 0.2%. The occurrence frequency of horizontal visibility below 1500 m and/or cloud ceiling below 500 ft in January is 16.2%.

8000 m nähtavuskauguse ja 2000 jala kõrguse pilve alumise piiri asemel on kasutatud vastavalt väärtsusi 5000 m ja 1500 jalga, mis on kohalike lennuprotseduuride ja erakorraliste ilmateadete aluseks.

Raja nähtavuskauguse esinemissagedus alla 200 m on veebruaris 0,1%. Alla 1500 m horisontaalse nähtavuse ja/või alla 500 jala pilve alumise piiri kõrguse esinemissagedus on 21%.

Instead of general visibility 8000 m and cloud base 2000 ft, visibility 5000 m and cloud base 1500 ft were used, since these are the limit values in local flight procedures and special weather reports.

In February, the observed occurrence of the Runway Visual Range minimum values below 200 m is 0.1%. The occurrence frequency of horizontal visibility below 1500 m and/or cloud ceiling below 500 ft in February is 21%.

8000 m nähtavuskauguse ja 2000 jala kõrguse pilve alumise piiri asemel on kasutatud vastavalt väärtsusi 5000 m ja 1500 jalga, mis on kohalike lennuprotseduuride ja erakorraliste ilmateadete aluseks.

Raja nähtavuskauguse väärtsusi alla 200 m juunis ei esinenud. Alla 1500 m horisontaalse nähtavuse ja/või alla 500 jala pilve alumise piiri kõrguse esinemissagedus on 6,2%.

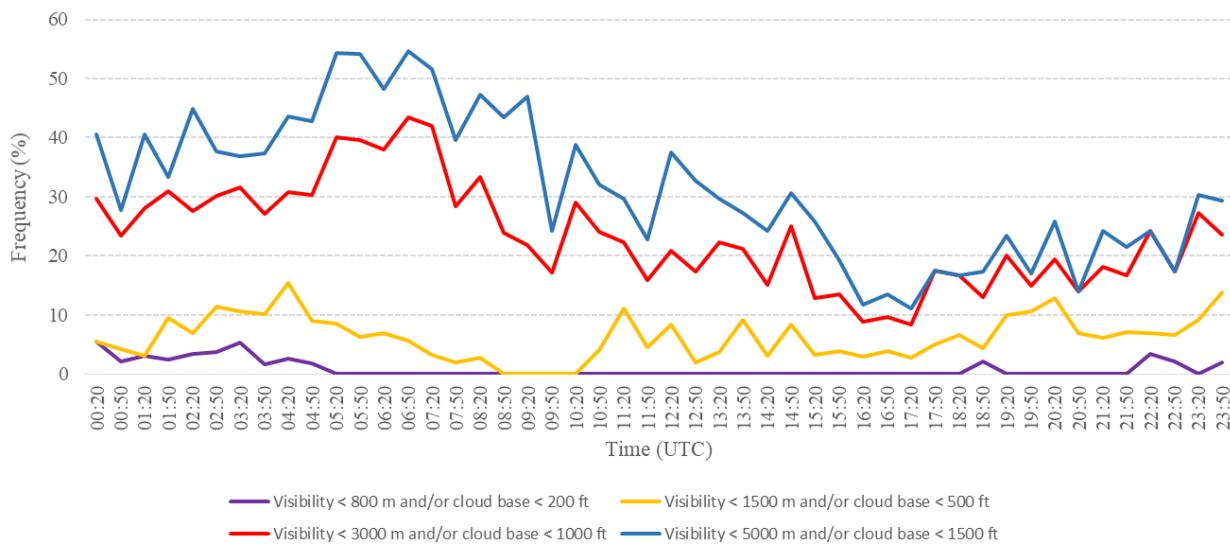

Instead of general visibility 8000 m and cloud base 2000 ft, visibility 5000 m and cloud base 1500 ft were used, since these are the limit values in local flight procedures and special weather reports.

In June, the observed occurrence of the Runway Visual Range minimum values below 200 m was not detected. The occurrence frequency of horizontal visibility below 1500 m and/or cloud ceiling below 500 ft in June is 6.2%.

Frequencies of RVR and/or lowest BKN/OVC cloud layer height  
below specified values in June

Frequencies of visibility and/or lowest BKN/OVC cloud layer height  
below specified values in June

8000 m nähtavuskauguse ja 2000 m kõrguse pilve alumise piiri asemel on kasutatud vastavalt väärtsusi 5000 m ja 1500 jalga, mis on kohalike lennuprotseduuride ja erakorraliste ilmateadete aluseks.

Raja nähtavuskauguse esinemissagedus alla 200 m on septembris 0,2%. Alla 1500 m horisontaalse nähtavuse ja/või alla 500 jala pilve alumise piiri kõrguse esinemissagedus on 11,5%.

Instead of general visibility 8000 m and cloud base 2000 ft, visibility 5000 m and cloud base 1500 ft were used, since these are the limit values in local flight procedures and special weather reports.

In September, the observed occurrence of the Runway Visual Range minimum values below 200 m is 0.2%. The occurrence frequency of horizontal visibility below 1500 m and/or cloud ceiling below 500 ft in September is 11.5%.

8000 m nähtavuskauguse ja 2000 jala kõrguse pilve alumise piiri asemel on kasutatud vastavalt väärtsusi 5000 m ja 1500 jalga, mis on kohalike lennuprotseduuride ja erakorraliste ilmateadete aluseks.

Raja nähtavuskauguse esinemissagedus alla 200 m on detsebris 0,2%. Alla 1500 m horisontaalse nähtavuse ja/või alla 500 jala pilve alumise piiri kõrguse esinemissagedus on 22%.

Instead of general visibility 8000 m and cloud base 2000 ft, visibility 5000 m and cloud base 1500 ft were used, since these are the limit values in local flight procedures and special weather reports.

In December, the observed occurrence of the Runway Visual Range minimum values below 200 m is 0.2%. The occurrence frequency of horizontal visibility below 1500 m and/or cloud ceiling below 500 ft in November is 22%.

## AERODROME CLIMATOLOGICAL SUMMARY: WIND SPEED AND DIRECTION

AERODROME: EETU

## MONTH: JANUARY

PERIOD OF RECORD: 2014-2020

TOTAL NUMBER OF OBSERVATIONS: 7510

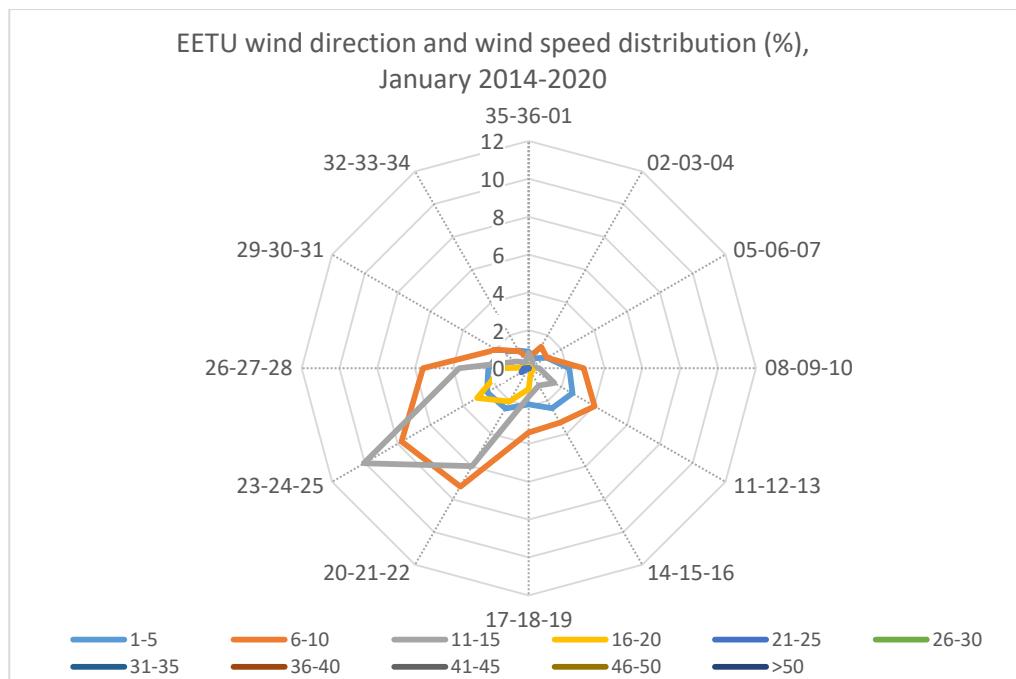

#### OBSERVATION INTERVAL: 30 MIN

LATITUDE 58° 18' 32"

LONGITUDE 26° 41' 36"

ELEVATION ABOVE MSI : 190 ft

Frequencies (%) of occurrence of concurrent wind direction (in 30° sectors) and speed within specified ranges

Detsembris jäab õhutemperatuur valdavalt vahemikesse 0...5 ja 0...-5 kraadi (vastavalt 55,50 ja 25,47%). Keskmise maksimaalne õhutemperatuur on vahemikus 10...15 kraadi (0,30%), keskmise minimaalne õhutemperatuur jäab vahemikku -10...-15 kraadi (0,83%).

In December, air temperature generally varies between 0...5 and 0...-5 degrees (55.50 and 25.47% accordingly). The highest average air temperature varies from 10 to 15 degrees (0.30%), whereas the lowest average air temperature remains into range -10...-15 degrees (0.83%).

## AERODROME CLIMATOLOGICAL SUMMARY: ATMOSPHERIC PRESSURE AND HUMIDITY

AERODROME: EETU

MONTHLY

PERIOD OF RECORD: 2014-2020

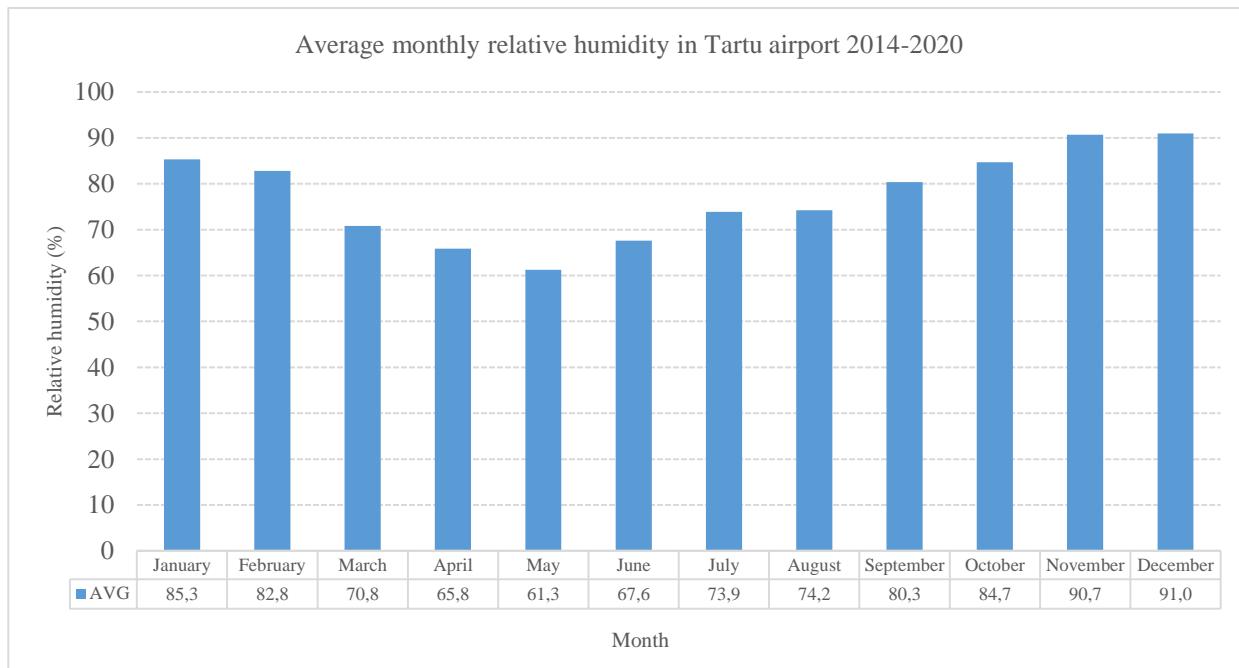

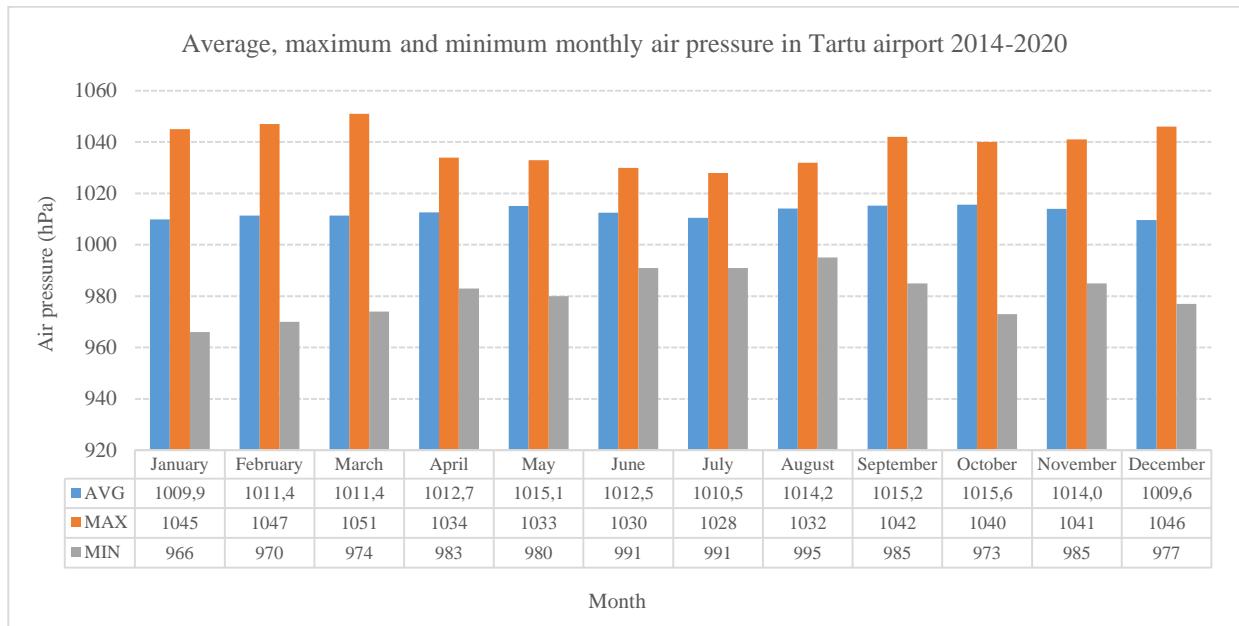

TOTAL NUMBER OF OBSERVATIONS:

OBSERVATION INTERVAL: 30 MIN

LATITUDE: 58° 18' 32"

LONGITUDE: 26° 41'36"

ELEVATION ABOVE MSL: 190 ft

Õhuniiskuse andmed on pärit Tartu Ülikooli füüsika instituudi katusel paiknevast ilmajaamast, mis asub Tartu lennujaamast ca 6,5 km kaugusel. Andmed on loetud Tartu lennujaama jaoks piisavalt esinduslikuks.

Relative humidity data originates from the weather station of University of Tartu Physics Institute which is located on the roof of the building about 6,5 km away from Tartu airport. Data is considered representative for Tartu airport.

Muud atmosfäärinähtused ei ole eristatud. Vihm lumega (RASN) on määratud vihmaks, lumi vihmaga (SNRA) on märgitud lumeks. Kerget lumesadu ei ole arvestatud protsentuaalselt liiga kõrge lumesaju määra tõttu, mis võib viia valede järeldusteni. Jäätuv vihm (FZRA) ja jäätuv uduvihm (FZDZ) ei ole eraldi välja toodud vaid on arvestatud vastavalt vihma (RA) ja uduvihma (DZ). Hoogvihm (SHRA) on määratud vihmaks ja hooglumi (SHSN) on määratud lumesajuks.

Jaanuaris esineb atmosfäärinähtustest kõige enam uduvinet ning lumesadu (vastavalt 8,4 ja 7,4%).

Other weather phenomenas are not distinguished. Rainsnow (RASN) is classified as rain, snowrain (SNRA) is located under snow criterion. Light snow is not included due to too high snowfall percentages which leads to false conclusions. Freezing rain (FZRA) and freezing drizzle (FZDZ) are not separated as well and are situated under rain (RA) and drizzle (DZ) criterion correspondingly. Showers of rain (SHRA) are classified as rain ja showers of snow (SHSN) are classified as snowfall.

In January, most frequent weather phenomenas are mist and snowfall (8.4 and 7.4% accordingly).

Muud atmosfäärinähtused ei ole eristatud. Vihm lumega (RASN) on määratud vihmaks, lumi vihmaga (SNRA) on märgitud lumeks. Kerget lumesadu ei ole arvestatud protsentuaalselt liiga kõrge lumesaju määra töttu, mis võib viia valede järeldusteni. Jäätuvi vihm (FZRA) ja jäätuvi uduvihm (FZDZ) ei ole eraldi välja toodud vaid on arvestatud vastavalt vihma (RA) ja uduvihma (DZ). Hoogvihm (SHRA) on määratud vihmaks ja hooglumi (SHSN) on määratud lumesajuks.

Aprillis esineb atmosfäärinähtustest kõige enam vihma ning uduvihma (vastavalt 6,2 ja 4,5%).

Other weather phenomenas are not distinguished. Rainsnow (RASN) is classified as rain, snowrain (SNRA) is located under snow criterion. Light snow is not included due to too high snowfall percentages which leads to false conclusions. Freezing rain (FZRA) and freezing drizzle (FZDZ) are not separated as well and are situated under rain (RA) and drizzle (DZ) criterion correspondingly. Showers of rain (SHRA) are classified as rain ja showers of snow (SHSN) are classified as snowfall.

In April, most frequent weather phenomenas are rain and drizzle (6.2 and 4.5% accordingly).

Muud atmosfäärinähtused ei ole eristatud. Vihm lumega (RASN) on määratud vihmaks, lumi vihmaga (SNRA) on märgitud lumeks. Kerget lumesadu ei ole arvestatud protsentuaalselt liiga kõrge lumesaju määra töttu, mis võib viia valede järeldusteni. Jäätuvi vihm (FZRA) ja jäätuvi uduvihm (FZDZ) ei ole eraldi välja toodud vaid on arvestatud vastavalt vihma (RA) ja uduvihma (DZ). Hoogvihm (SHRA) on määratud vihmaks ja hooglumi (SHSN) on määratud lumesajuks.

Novembris esineb atmosfäärinähtustest kõige enam uduvinet ning uduvihma (vastavalt 12,0 ja 6,1%).

Other weather phenomenas are not distinguished. Rainsnow (RASN) is classified as rain, snowrain (SNRA) is located under snow criterion. Light snow is not included due to too high snowfall percentages which leads to false conclusions. Freezing rain (FZRA) and freezing drizzle (FZDZ) are not separated as well and are situated under rain (RA) and drizzle (DZ) criterion correspondingly. Showers of rain (SHRA) are classified as rain ja showers of snow (SHSN) are classified as snowfall.

In November, most frequent weather phenomenas are mist and drizzle (12.0 and 6.1% accordingly).

Frequency of freezing fog (FZFG) occurrence by months (2014-2020)

## AERODROME CLIMATOLOGICAL SUMMARY: PRECIPITATION

AERODROME: EETU

MONTHLY

PERIOD OF RECORD: 2014-2020

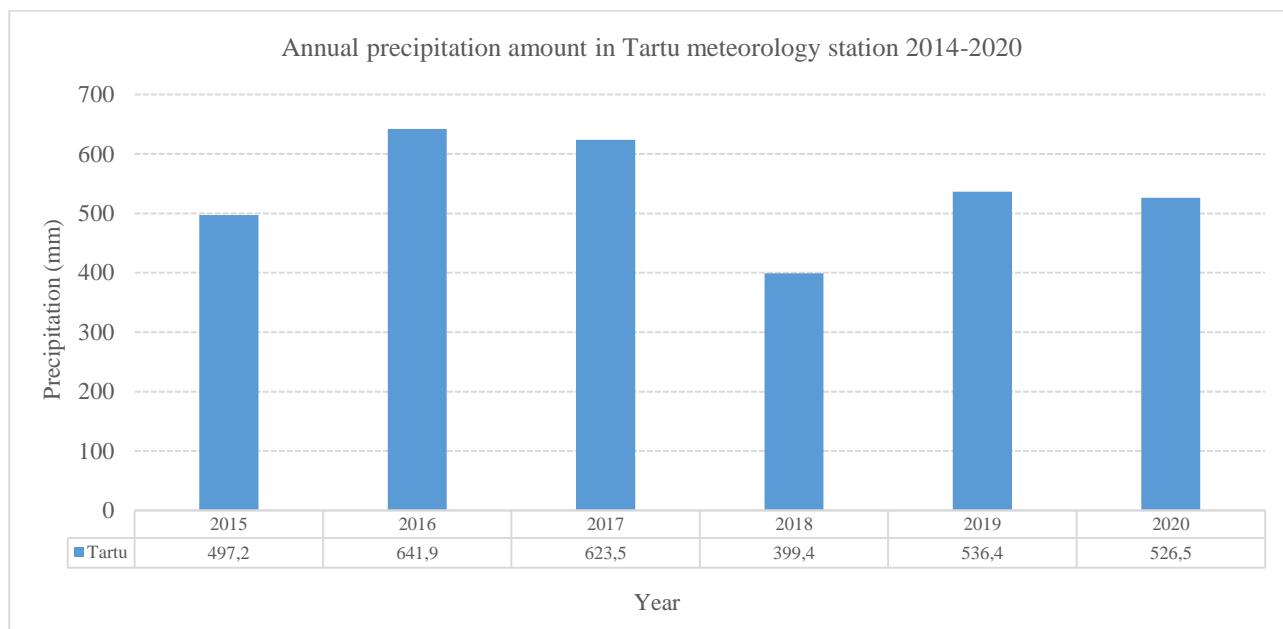

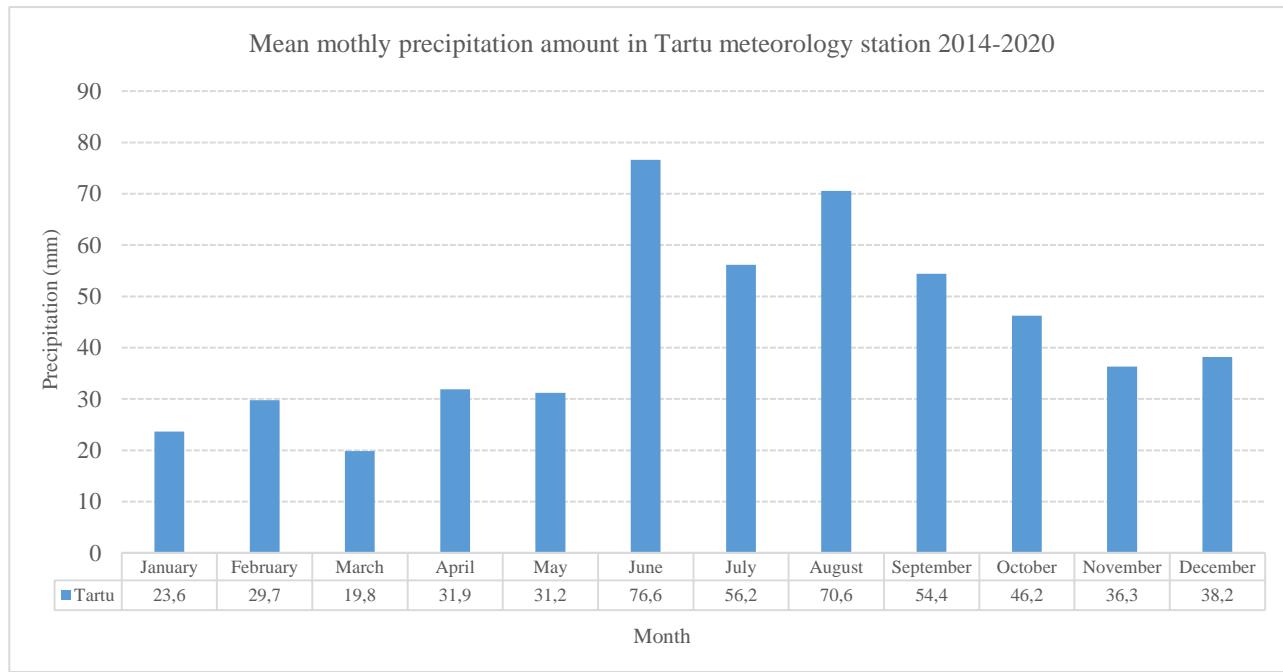

TOTAL NUMBER OF OBSERVATIONS:

OBSERVATION INTERVAL: 30 MIN

LATITUDE: 58° 18' 32"

LONGITUDE: 26° 41'36"

ELEVATION ABOVE MSL: 190 ft

Tartu Ülikooli füüsikahoone ilmajaama andmetel sajab kõige enam juunis (76,6 mm) ning kõige vähem jaanuaris ja märtsis (vastavalt 23,6 ja 19,8 mm). Tartu Lennuväljal sademeid ei mõõdeta, aga kuna nende omavaheline kaugus on 6,5 km, siis võib Tartu Ülikooli füüsikahoone ilmajaama sademete andmeid pidada esinduslikeks ja Tartu Lennujaama jaoks.

According to the weather station on physic department building of University of Tartu, the wettest month is June (76.6 mm) and the driest months are January and March (23.6 and 31.6 mm accordingly). At Tartu Aerodrome there are no precipitation measurements. However distance between these two locations is approximately 6.5 km, we could asses the data of physic department building of University of Tartu representative for Tartu Aerodrome.

## Kokkuvõte / Summary

Tartu lennuvälja kliimateatmik on Tartu Lennujaama meteoroloogiliste andmete statistiline analüüs. Teatmik sisaldab 7 aastase perioodi (2014-2020) kohta meteoroloogiliste elementide jaotust ning olulisemaid lennu-meteoroloogilisi statistilisi näitajaid.

Analüüs tugineb Rahvusvahelise Tsiviillennunduse Organisatsiooni (ICAO) ja Ülemaailmse Meteoroloogia-organisatsiooni (WMO) kliimaandmete töötlemise soovitustele.

Raja nähtavuskauguse väärtsusi alla 200 m on esinenuud üksikutel vaatluskordadel peaaegu kögil kuudel. Alla 1500 m horisontaalse nähtavuse ja/või alla 500 jala pilve alumise piiri körguse esinemissagedus on suurim talvekuudel ning väikseim suvekuudel.

Kõigil aastaaegadel jäääb valdag tuule suund vahemikku 230-250 kraadi. Keskmne tuule kiirus on vahemikus 6-10 sõlme.

Novembrist aprillini jäääb keskmne õhutemperatuur vahemikku 0...5 kraadi, mais ja septembris vahemikku 10...15, juunist augustini vahemikku 15...20 ja oktoobris on vahemikus 5...10 kraadi. Keskmne maksimaalne õhutemperatuur on vahemikus 30...35 kraadi, keskmne minimaalne õhutemperatuur jäääb alla -20 kraadi.

Atmosfäärinähtustest esineb kõige enam vihma, uduvinet ja uduvihma (vastavalt 5,8, 5,3 ja 4,2%).

Kõige enam sajab juunis (76,6 mm) ning kõige vähem jaanuaris ja märtsis (vastavalt 23,6 ja 19,8 mm).

Tartu aerodrome Climate handbook is a statistical analysis of the observations data provided by Tartu Airport. The handbook covers a 7-year period between 2014 – 2020 and contains the distribution of meteorological elements, and significant statistical parameters of aviation meteorology.

The analysis are based on the recommendations of the International Civil Aviation Organization (ICAO) and the World Meteorological Organization (WMO) on climatological data processing.

The Runway Visual Range minimum values below 200 m were measured only at solitary observational occasions almost in every month. The occurrence frequency of horizontal visibility below 1500 m and/or cloud ceiling below 500 ft is the highest during winter months and the lowest during summer months.

The prevailing wind direction in all seasons is 230-250 degrees. Wind speed is mainly 6-10 knots.

From November to April the mean air temperature generally varies between 0...5 degrees, in May and in September 10...15, from June to August 15...20 degrees and in October 5...10 degrees. The highest average air temperature varies in range of 30...35 degrees, whereas the lowest air temperature remains below -20 degrees.

The most frequent weather phenomenas are rain mist and drizzle (5.8, 5.3 and 4.2% accordingly).

The wettest month is June (76.6 mm) and the driest months are January and March (23.6 and 19.8 mm accordingly).
